

Year One

Year Two

Practical and written methods

Pupils should be taught to:

- Given a number up to 100, identify one more and one less
- read, write and interpret mathematical statements involving addition (+), subtraction (-) and equals (=) signs
- represent and use number bonds and related subtraction facts within 20
- add and subtract one-digit and two-digit numbers to 20, including zero
- solve one-step problems that involve addition and subtraction, using concrete objects and pictorial representations, and missing number problems

Pupils should use real objects and apparatus to develop the concepts of addition and subtraction. They use a wide range of objects and use calculation in a range of contexts to develop a broad understanding and fluency in their skills. Talking about what they are doing with peers and adults is a very important part of the process of developing concepts. Addition and subtraction are explored as related operations

Understanding addition as combining two sets of objects

- Use games, songs and practical activities to develop understanding of addition in a wide range of different contexts and develop the vocabulary of addition.
- Support children to make a record in pictures, words or symbols, of addition activities.

- Construct number sentences verbally to go with practical activities.
- Solve simple word problems
- Introduce symbols as ways to record their addition activities
- Use Numicon to explore pattern in addition and support visualisation of addition facts.
- Children record addition sentences alongside their practical addition.
- Explore the concept of "is equal to" and relate this to the = sign. They begin with the format 2+3=5 and then use 5=2+3
- They are supported to move on from counting both sets to counting on from the first number

Understanding subtraction as 'taking away'

Use games, songs and practical activities to develop understanding of subtraction in a wide range of different contexts and develop the vocabulary of subtraction

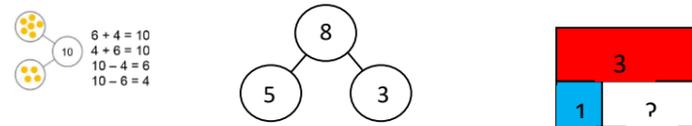

- Support children to make a record of subtraction activities in pictures, words or symbols.

- Construct number sentences verbally to go with practical activities
- Solve simple word problems
- Use Numicon with subtraction covers to emphasise the relationship between addition and subtraction.
- Introduce symbols as ways to record their addition activities
- Children record addition sentences alongside their practical addition.

Exploring the relationship between addition and subtraction

Children use the part / part whole model to explore the relationship between addition and subtraction and to construct fact families.

They solve problems with missing numbers

3 + 4 = □ □ = 3 + 4 3 + □ = 7 7 = □ + 4 7 = 3 + □ 4 - □ = 1 7 = □ - 9 □ - 9 = 7

Pupils should be taught to:

Represent and use add and subtract numbers using concrete objects, pictorial representations, and mentally, including:

- a two-digit number and ones, a two-digit number and tens, two two-digit numbers
- adding three one-digit numbers
- show that addition of two numbers can be done in any order (commutative)
- recognise and use the inverse relationship between addition and subtraction and use this to check calculations and solve missing number problems.

Place Value

Pupils need to have a secure understanding of place value in order to calculate with 2 digit numbers. To secure this they need opportunities to explore different aspects of place value using a variety of models and representations including dienes apparatus, place value counters, Numicon and arrow cards. They should play simple base 10 exchange games to build understanding of the values represented by digits and exchange between tens and ones.

They will practise using their understanding of place value to add a two-digit number and ones and a two-digit number and tens.

They partition 2 digit numbers in different ways e.g. 23 = 20+3 or 13+10.

Combine numbers using Dienes or place value counters vertically placed

Children begin by using an expanded written method for column addition to secure their understanding of the process and then move onto using the formal written method.

		<p>Expanded version</p> $30 + 1$ $+ 10 + 2$ <hr/> $40 + 3 = 43$	<p>Formal written method</p> $\begin{array}{r} 31 \\ +12 \\ \hline 43 \end{array}$
--	--	---	--

- Column addition, without crossing tens TO + T , TO +TO
- Then Column addition regrouping ones to tens

At each stage

Begin with practical method, describe process verbally and represent as expanded version . When understanding is secure, represent as column addition. Retain models alongside written representations, including Dienes, money and Numicon until children are secure.

Subtract numbers using Dienes, vertically placed

- Column subtraction, without regrouping TU - T , then TU -TU

<p>Expanded version</p> $45 - 22$ $45 = 40 \text{ and } 5$ $-22 = 20 \text{ and } 2$ <hr/> $20 \text{ and } 3 = 23$	<p>Formal written method</p> $\begin{array}{r} 45 \\ -22 \\ \hline 23 \end{array}$
---	--

- Children who are secure in subtraction without exchange will move onto column subtraction with exchange. This is a requirement for children who are working at Greater Depth.

<p>Expanded version</p> $42 - 27$ $42 = 30 \text{ and } 12$ $-27 = 20 \text{ and } 7$ <hr/> $10 \text{ and } 5 = 15$	
--	--

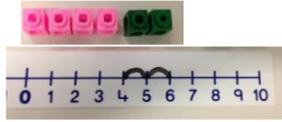

Using the relationship between addition and subtraction

- Children continue to use the Part part whole models introduced in Year 1 to support them in recognising and using the inverse relationship between addition and subtraction and using this to check calculations and solve missing number problem

Mental methods

Understanding addition as increasing numbers and subtraction as decreasing numbers

- Find 'one more' and one less to one hundred by counting or back on verbally
- Children begin to use floor and table number lines to support their own calculations counting on in ones within 20.

$7 + 4$

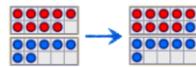

$8 - 3 = 5$

Children count on mentally to add and count back mentally to subtract using fingers to record the count if needed.

Ten frames or bead strings are used to represent addition including bridging through ten.

$9 + 7 = 16$

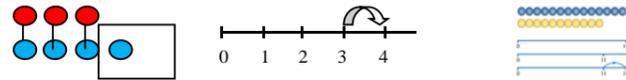

$8 + 5 = 13$

Understand subtraction as difference

Use practical apparatus, drawings and number lines to solve problems by finding the difference between two numbers

Mental Recall of facts and Calculation strategies

Use practical apparatus and visual images to reinforce number facts and introduce specific calculation strategies.

Children explore the strategies practically explaining how they are working out the calculation. They are encouraged to find the most efficient strategy to work to calculations.

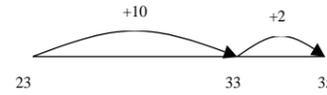

- Memorise and reason with number bonds of 4, 5, 6, 7, 8, 9 and 10 in several forms (for example, $2 + 7 = 9$; $9 - 7 = 2$; $2 = 19 - 7$). This is an important focus in Year 1.
- Derive and use bonds to 20.
- Count on and back in ones from a given 2-digit number
- Add three single-digit numbers identifying doubles or pairs to 10
- Add 10 to a single digit number; Subtract 10 from any given 2-digit number
- Use number facts to add single-digit numbers to two-digit numbers, e.g. use $4 + 3$ to work out $14 + 3$,
- Add by putting the larger number first
- Recognise doubles of numbers up to double 10.
- Use the commutative law: $5 + 4 = 4 + 5$
- Use number facts to subtract single-digit numbers from two-digit numbers, e.g. use $7 - 2$ to work out $17 - 2$,

Mental methods

Use a range of mental calculation strategies increasing or decreasing numbers e.g.

- Count on or back in tens and ones,**

$23 + 12 = 23 + 10 + 2$

- Partitioning and bridging through 10 and multiples of ten**

Children continue to use ten frames to model bridging through ten and multiples of ten. They represent this on a number line.

$19 + 7 = 26$

$19 + 1 + 6 = 26$

- Find the difference by counting up in tens and ones**

This method is used when solving problems involving finding change from an amount of money

What is the difference between 56 and 72?

Mental Recall of facts and Calculation strategies

Pupils use table number lines then draw empty number lines to support or explain their mental calculation strategies.

- Number bonds – know all the pairs of numbers which make all the numbers to 20,
- derive and use related addition facts to 100
- Count on in ones and tens from any given 2-digit number
- Add two or three single-digit numbers identifying doubles or pairs to 20
- Add a single-digit number to any 2-digit number using number facts, including bridging multiples of 10. (E.g. $45 + 4$, $38 + 7$)
- Add 10 and small multiples of 10 to any given 2-digit number
